dsRNA-binding protein 4F.2 - African clawed frog (fragment)
C:Species: Xenopus laevis (African clawed frog)
C:Date: 13-Sep-1996 #sequence_revision 13-Sep-1996 #text_change
C:Accession: 11653
R:Bass, B.L.; Hurst, S.R.; Singer, J.D.

The specification also describes chimeric polypeptides that comprises an amyloidogenic domain that causes aggregation into
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     that comprises an amyloidogenic domain that causes aggregation into fibrils. The chimeric polypeptides are used to prepare polymers with multiple reactivities, e.g. derivatised with enzymes, or specific binding partners, and useful e.g. for performing multi-step chemical reactions. They can be used create an inducible, or stable phenotypic alteration in a cell, e.g. for gene therapy, protein production, imparting disease resistance to plants, altering plant pigmentation and
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                possesses the prion-like capacity to undergo a self-perpetuating conformational alteration that changes the functional state of a manner that creates a heritable change in phenotype. It is used to be a manner that creates a heritable change in phenotype.

New nucleic acid encoding chimeric proteins with self-assembly properties, useful e.g. for diagnosis and treatment of prion diseases, also related aggregates, fibrils and polymers -
                                                                                                                                                        Claim 11; Page 135-136; 188pp; English
```

The present sequence represents a modified N region of Sup35 protein, in Ct the second oligopeptide repeat has been expanded twice, creating a total cof seven repeats. Sup35 possesses the prion-like capacity to undergo a cc self-perpetuating conformational alteration that changes the functional cstate of Sup35 in a manner that creates a heritable change in phenotype. It is used to construct chimeric polypeptides of the invention, which cc comprise at least one SCHAG (self-coalesces into higher-order aggregates) camino acid sequence fused in frame with a polypeptide of interest (which cc is other than a marker protein, a glutathione-S-transferase or a cc staphylococcal nuclear protein). The specification also describes chimeric polypeptides that comprises an amylodogenic domain that causes capgregation into fibrils. The chimeric polypeptides are used to prepare cc polymers with multiple reactivities, e.g. derivatised with enzymes, or specific binding partners, and useful e.g. for performing multi-step chemical reactions. They can be used create an inducible, or stable production, imparting disease resistance to plants, altering plant pigmentation and for Sequence 271 AA diagnosis and treatment of prion diseases

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            The specification describes chimeric polypeptides which comprise at cleast one SCHAG (self-coalesces into higher-order aggregates) amino acid sequence fused in frame with a polypeptide of interest (which is other than a marker protein, a glutathione-5-transferase or a staphylococcal nuclear protein). The specification also describes chimeric polypeptides that comprises an amyloidogenic domain that causes aggregation into fibrils. The chimeric polypeptides are used to prepare polymers with multiple reactivities, e.g. derivatised with enzymes, or specific binding partners, and useful e.g. for performing multi-step chemical reactions. They can be used create an inducible, or stable production, imparting disease resistance to plants, altering plant pigmentation and for diagnosis and treatment of prion diseases. The present sequence is used in the course of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Query Match

The specification CC describes chimeric polypeptides, which comprise at least one SCHAG CC (self-coalesces into higher-order aggregates) amino acid sequence fused in frame with a polypeptide of interest (which is other than a marker CC protein, a glutathione-S-transferase or a staphylococcal nuclear CC protein). The specification also describes chimeric polypeptides that CC comprises an amyloidogenic domain that causes aggregation into fibrils. CC The chimeric polypeptides are used to prepare polymers with multiple CC reactivities, e.g. derivatised with enzymes, or specific binding CC partners, and useful e.g. for performing multi-step chemical reactions. CC They can be used create an inducible, or stable phenotypic alteration CC in a cell, e.g. for gene therapy, protein production, imparting disease cresistance to plants, altering plant pigmentation and for diagnosis and treatment of prion diseases.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Matches

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     AAB30821-23 represent putative prion proteins which have been didentified from a yeast protein database. The specification describes chimeric polypeptides, which comprise at least one SCHAG (self-coalesces into higher-order aggregates) amino acid sequence fused in frame with a polypeptide of interest (which is other than a marker protein, a glutathione-S-transferase or a staphylococcal nuclear comprises an amyloidogenic domain that causes aggregation into fibrils. The specification also describes chimeric polypeptides that comprises an amyloidogenic domain that causes aggregation into fibrils. The chimeric polypeptides are used to prepare polymers with multiple reactivities, e.g. derivatised with enzymes, or specific binding partners, and useful e.g. for performing multi-step chemical reactions. They can be used create an inducible, or stable phenotypic alteration in a cell, e.g. for gene therapy, protein production, imparting disease resistance to plants, altering plant pigmentation and for diagnosis and treatment of prion diseases.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Query Match

The specification also describes chimeric polypeptides that comprises an amyloidogenic domain that causes aggregation into fibrils. The chimeric polypeptides are used to prepare polymers with multiple reactivities, e.g. derivatised with enzymes, or specific binding partners, and useful e.g. for performing multi-step chemical reactions. They can be used create an inducible, or stable production, imparting disease resistance to plants, altering plant pigmentation and for diagnosis and treatment of prion diseases. The present sequence is used in the course of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                WPI;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            The sequence is encoded by the SYT gene (synovial sarcoma ctranslocation). The gene is at the location of a chromosome-18q11.2 Cb breakpoint associated with synovial sarcoma, and is associated with CC the translocation t(x;18)(p11.2;q11.2) found in human synovial certains and involving joining of the SYT gene to either SSX1 (encoding AAR90676) or SSX2 (encoding AAR90677) on the x-chromosome at CC (encoding AAR90676) or SSX2 (encoding AAR90677) on the x-chromosome at CC (AAR90679) or SYT-SSX2 (AAR90678) fusion proteins. The SYT protein is CC (AAR90679) or SYT-SSX2 (AAR90678) fusion proteins. The SYT protein is CC rich in glutamine (19%), proline (16%) and glycine (14%), and there CC are several consensus glycosylation and phosphorylation sites. CC Detection of the gene or its product either in an abnormal location CC or as a fusion may be used in diagnosis of synovial sarcoma, using CC primers, probes, humanised antibodies, monoclonal antibodies, etc. CC Antisense oligonucleotides and antibodies may also be used therapeutically, and antitumour recombinant vaccines may be

                                                                                                                                                                                                                                                                                                                                                                     plumbaginafolia. Degenerate reverse primers corresponded to AGP N-terminal AA sequence were synthesised and used to obtain a company of the primer extension product, which was then amplified by PCR. Additional primers, corresp. In sequence to parts of the 160-bp of fragment were synthesised and used to amplify the 3' part of the AGP gene by nested PCR. The primers were AAQ92536 and AAQ92537. A company of the PCR. The primers were AAQ92536 and AAQ92537. A company of the two PCR reactions gave rise to a DNA sequences obtd. From the two PCR reactions gave rise to a DNA sequence shown. The PCR fragment encodes a protein contq. The PCR fragment was used to screen a cDNA company made from RNA isolated from N. alata cells. The alignment of the PCR sequences with the cDNA sequence gave rise to AAQ92524. The calc. mol. wt. of the encoded protein is 51.8 kD with a
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          The N-terminal region of an arabinogalactan protein (AGP) was obtd from N. alata suspension culture. It was used as a template for the synthesis of an oligo primer which was further utilised for the isolation of a hybridising AGP gene from both N. alata and N.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Bacic A,

                                                                                                                                                                                                                                                                                                                                                     В
                                                                                                                                                                                                                                                                                                                                                                              identified from a yeast protein database. The specification describes chimeric polypeptides, which comprise at least one SCHAG (self-coalesces into higher-order aggregates) aminol acid sequence fused in frame with a polypeptide of interest (which is other than a marker protein). The specification also describes chimeric polypeptides that comprises an amyloidogenic domain that causes aggregation into fibrils. The chimeric polypeptides are used to prepare polymers with multiple reactivities, e.g. derivatised with enzymes, or specific binding partners, and useful e.g. for performing multi-step chemical reactions. They can be used create an inducible, or stable phenotypic alteration in a cell, e.g. for gene therapy, protein production, imparting disease cresistance to plants, altering plant pigmentation and for diagnosis

                                                                                                                                                                                                                                                                                                                                                                                 DNA encoding the promoter is used in a gene construct with a distructer gene such as the mammalian uncoupling protein gene, or a mutated form of the gene for the beta subunit of F1-AFDase. The promoter operates in the target tissue and expression of the distributer gene inhibits respiration resulting in cell death. This is of particular use for inhibiting male fertility in maize crops where cell death results in failure to produce viable pollen. When inserted into a gene cascade, as a module which permits external control of expression, fertility may also be restored if required. See also AAR06524 and AAR06525.
